

Sprint 1 Report (January 12th – February 22nd)

Sprint Report 1 Video | Part 1

What's New (User Facing)

- Basic react native template using Expo framework
- Secure api key handling with server-side logic and local api keys file
- Login button on phone connected with server successfully

Work Summary (Developer Facing)

In this sprint we have done extensive research on how to develop in react native, and decided on what framework to build our application in. We have also investigated the specific hardware needed to complete this assignment, and we have covered it ourselves. We have coded a functional prototype of the application where you are able to enter an email and password, and login to the site using a POST request through a react-native expo framework. Using expo-go, we have tested the prototype application, and it has succeeded in logging into the site (where the user should be able to see their public data).

Unfinished Work

The home page for our application was unfinished. Basic functionality was implemented, though the login/ signup functionality is not paired with an easy-to-use user interface for the user. This is considered a non-functional requirement and is not vital for the program's basic functionality. The reason we did not complete this non-functional feature was because we ran out of time. Sprint 1 was largely focused on researching the languages, frameworks, and acquiring the necessary hardware to start the development process.

Completed Issues/User Stories

- Completed Login button and authentication
 - Completed by Ethan
- Secure api key handling
 - Completed by Connor

Incomplete Issues/User Stories

Here are links to issues we worked on but did not complete in this sprint:

- App Home Page
 - We ran out of time for sprint 1. We spent the majority of the sprint conducting research on languages, frameworks, and hardware (Hardware took a week to get ahold of and experiment with).

Code Files for Review

Please review the following code files, which were actively developed during this sprint, for quality:

- [Backend Server Logic](#)
- [Frontend Template](#)
- [Name of code file 3](#)

Retrospective Summary

Here's what went well:

- Developing a login page
- Deciding on what framework to use
- Item 1 Here's what we'd like to improve: Login page needs a home page after a successful login
